1.

For which of the following problems would anomaly detection be a suitable algorithm?

In a computer chip fabrication plant, identify microchips that might be defective.

**Correct**

The defective chips are the anomalies you are looking for by modeling the properties of non-defective chips.

From a large set of primary care patient records, identify individuals who might have unusual health conditions.

**This should be selected**

Given data from credit card transactions, classify each transaction according to type of purchase (for example: food, transportation, clothing).

**This should not be selected**

Anomaly detection is not appropriate for a traditional classification problem.

From a large set of hospital patient records, predict which patients have a particular disease (say, the flu).

**Un-selected is correct**

2.

Suppose you have trained an anomaly detection system that flags anomalies when  $p(x)$  is less than  $\epsilon$ , and you find on the cross validation set that it has too many false negatives (failing to flag a lot of anomalies). What should you do?

Quiz, 5 questions 4/5 points (80%)

☒ Increase  $\epsilon$

**Correct**

By increasing  $\epsilon$ , you will flag more anomalies, as desired.

☐ Decrease  $\epsilon$

3.

Suppose you are developing an anomaly detection system to catch manufacturing defects in airplane engines. Your model uses

$$p(x) = \prod_{j=1}^n p(x_j; \mu_j, \sigma_j^2).$$

You have two features  $x_1$  = vibration intensity, and  $x_2$  = heat generated. Both  $x_1$  and  $x_2$  take on values between 0 and 1 (and are strictly greater than 0), and for most "normal" engines you expect that  $x_1 \approx x_2$ . One of the suspected anomalies is that a flawed engine may vibrate very intensely even without generating much heat (large  $x_1$ , small  $x_2$ ), even though the particular values of  $x_1$  and  $x_2$  may not fall outside their typical ranges of values. What additional feature  $x_3$  should you create to capture these types of anomalies:

☐  $x_3 = x_1 \times x_2^2$

☐  $x_3 = x_1^2 \times x_2^2$

☐  $x_3 = (x_1 + x_2)^2$

☒  $x_3 = \frac{x_1}{x_2}$

**Correct**

This is correct, as it will take on large values for anomalous examples and smaller values for normal examples.

4.

Which of the following are true? Check all that apply.

If you do not have any labeled data (or if all your data has label  $y = 0$ ), then it is still possible to learn  $p(x)$ , but it may be harder to evaluate the system or choose a good value of  $\epsilon$ .

# Anomaly Detection

Quiz, 5 questions Only negative examples are used in training, but it is good to have some labeled data of both types for cross-validation. **4/5 points (80%)**

- ☐ When choosing features for an anomaly detection system, it is a good idea to look for features that take on unusually large or small values for (mainly the) anomalous examples.

**Correct**

These are good features, as they will lie outside the learned model, so you will have small values for  $p(x)$  with these examples.

- ☐ If you have a large labeled training set with many positive examples and many negative examples, the anomaly detection algorithm will likely perform just as well as a supervised learning algorithm such as an SVM.

**Un-selected is correct**

- ☐ If you are developing an anomaly detection system, there is no way to make use of labeled data to improve your system.

**Un-selected is correct**

5.

You have a 1-D dataset  $\{x^{(1)}, \dots, x^{(m)}\}$  and you want to detect outliers in the dataset. You first plot the dataset and it looks like this:

Suppose you fit the gaussian distribution parameters  $\mu_1$  and  $\sigma_1^2$  to this dataset. Which of the following values for  $\mu_1$  and  $\sigma_1^2$  might you get?

- ☐  $\mu_1 = -3, \sigma_1^2 = 4$

# Anomaly Detection

Quiz, 5 questions

4/5 points (80%)

This is correct, as the data are centered around -3 and tail most of the points lie in [-5, -1].

☐  $\mu_1 = -6, \sigma_1^2 = 4$

☐  $\mu_1 = -3, \sigma_1^2 = 2$

☐  $\mu_1 = -6, \sigma_1^2 = 2$
